

AMENDMENTS TO THE ABSTRACT

Please replace the original Abstract with the attached replacement Abstract.

ABSTRACT

A shelving system in which one or more shelves are supported by a support structure. An electrical component, such as a lamp, a display, or a speaker, is mounted on the shelf or the support member. In one variation, the support is arranged to provide two discrete electrically conductive paths, at least one of which is electrically connected to the electrical component to form part of an electrical circuit to power the electrical component.
